
HELM : Application Package Manager for K8s

HELM : Before HELM

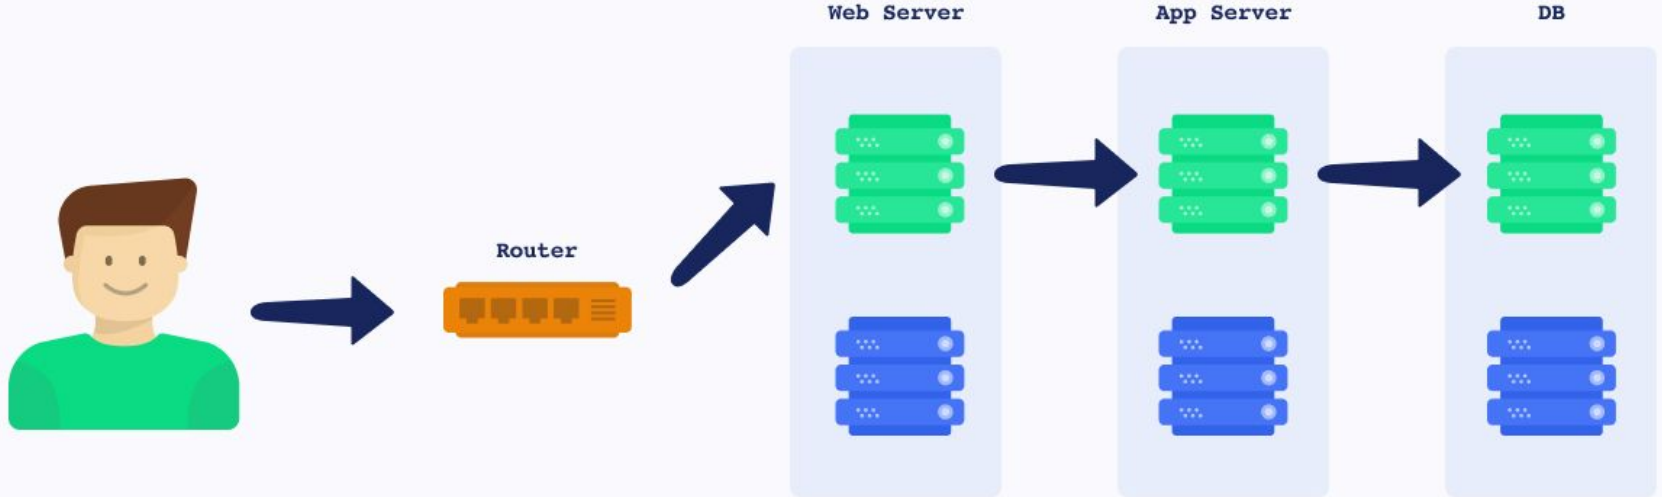

HELM : K8s Packaging Manager

- WithOut HELM-
 - Teams rely on Kubernetes YAML files to configure Kubernetes workload.
 - YAML files specify everything needed for deploying containers.
 - Set up a new Kubernetes workload, you need to create a YAML file for that workload.
 - All YAML files, you creating for Kubernetes are Static. They don't receive parameters dynamically.
- Consistency is the major issue with Hand Crafted YAMLs or Deployments.

HELM : K8s Packaging Manager

- Kubernetes Can't maintain the revision History.

Thank You...

Don't be the Same! Be Better!!!
